Complete User Flow (Authentication, Organizations, Roles, Payments)

Purpose

This document clarifies when organization license billing occurs, how organization membership and roles work, and why the login screen shows role selection even though registration does not. It reflects the current codebase and database migrations.

1. Authentication & Organization Flow

Users either create a new organization or join an existing organization via invitation.

1.1 Creating a New Organization (Org Admin Onboarding)

Entry point: Login page CTA 'Get Started Free / Setup an Organization' (src/pages/Login.tsx).

If authenticated, the user is redirected to /admin/onboarding. If not authenticated, a setup flag is stored and the user is redirected to /portal/signup.

Organization Creation

The organization is created during onboarding. At this moment, the creator is inserted into organization_members with role='org_admin'. This is the definitive point where admin privileges are granted.

License Payment Timing

Intended: during onboarding step 2 or via billing pages using Stripe Checkout.

Current state: payment is not yet implemented and is marked as TODO.

1.2 Joining an Existing Organization (Invite-Based)

Users join via /portal/accept-invite?token=...

Invite acceptance inserts a membership with the role specified in the invite. No payment occurs during this flow.

2. Role Management

organization_members.role is the canonical source of truth for roles.

Roles are assigned during organization creation, invite acceptance, or via platform admin assignment.

Login Role Selector Clarification

The role selector on the login page is currently UX-only. It does not affect authentication or permissions.

3. Registration Rules

Registration is role-agnostic. Roles are assigned only when a user joins or creates an organization.

Admin access cannot be self-selected during signup.

4. Payments Overview

Organization license payments use Stripe Checkout in subscription mode.

Parent payments are handled separately via non-subscription Stripe Checkout flows.

Summary

- Registration remains role-agnostic.
- Roles are assigned via organization context.
- Admin access is flow-controlled, not user-selected.
- Stripe handles both organization subscriptions and parent payments via separate flows.
